Build and Release

Build and Release

Visual Studio Team Services

Testimonial 4: All-4-1 1-4-All

Build Management Goals

- Support continuous integration
- Validate application correctness
- Enable continuous delivery
- Act as a quality indicator

Do I need release management

- You develop applications and need to **deploy** them **regularly** to any platform.
- You use a **Continuous Integration** (CI) system.
- You need to **track the progress** of releases.
- You need **control** of the deployments.
- You need **audit** history for all releases and their deployments.

Release Definitions

A release definition is one of the fundamental concepts in Release Management. It defines:

- The types and sources of **artifacts** that make up new releases.
- The collection of **environments** in which the artifacts can be deployed.
- The automation **tasks** that can be executed in each environment

Workflow

- Create release definitions.
- Add environments.
- Add Tasks.
- Create and deploy releases.
- Track deployments.

Environments

Sample Application:

- ToDoListAngular = Front end website
- ToDoListData API = Backend C# Service
- Data = Azure SQL

Code Environments:

Dev

QA

Hotfix (optional)

UAT (optional)

Production

Deployment Environments:

Dev

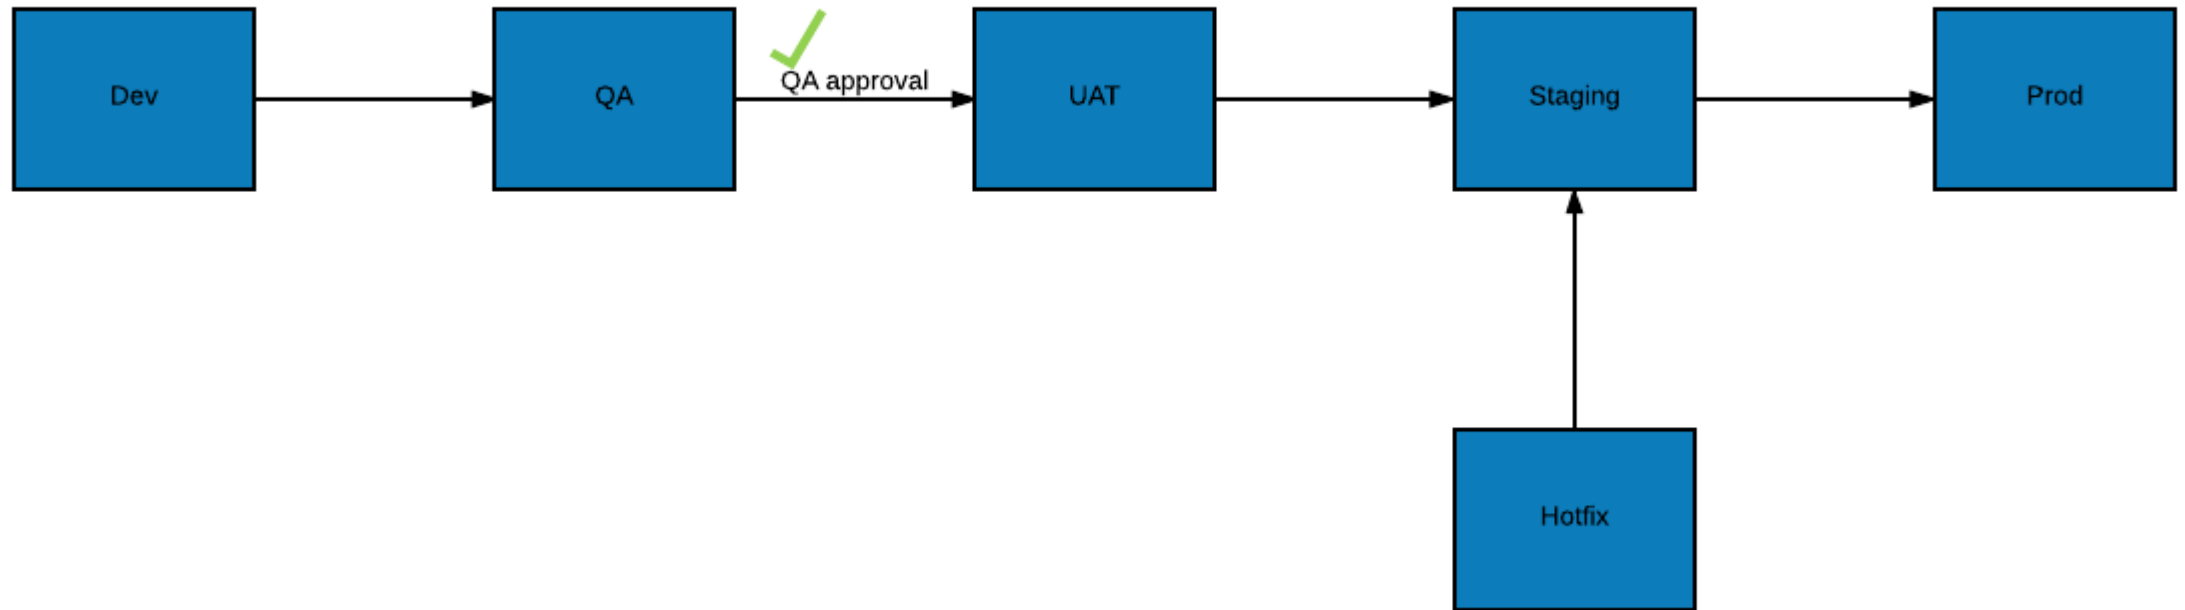

QA

Staging (optional)

Production

**Scaling is not available for non-production slots.*

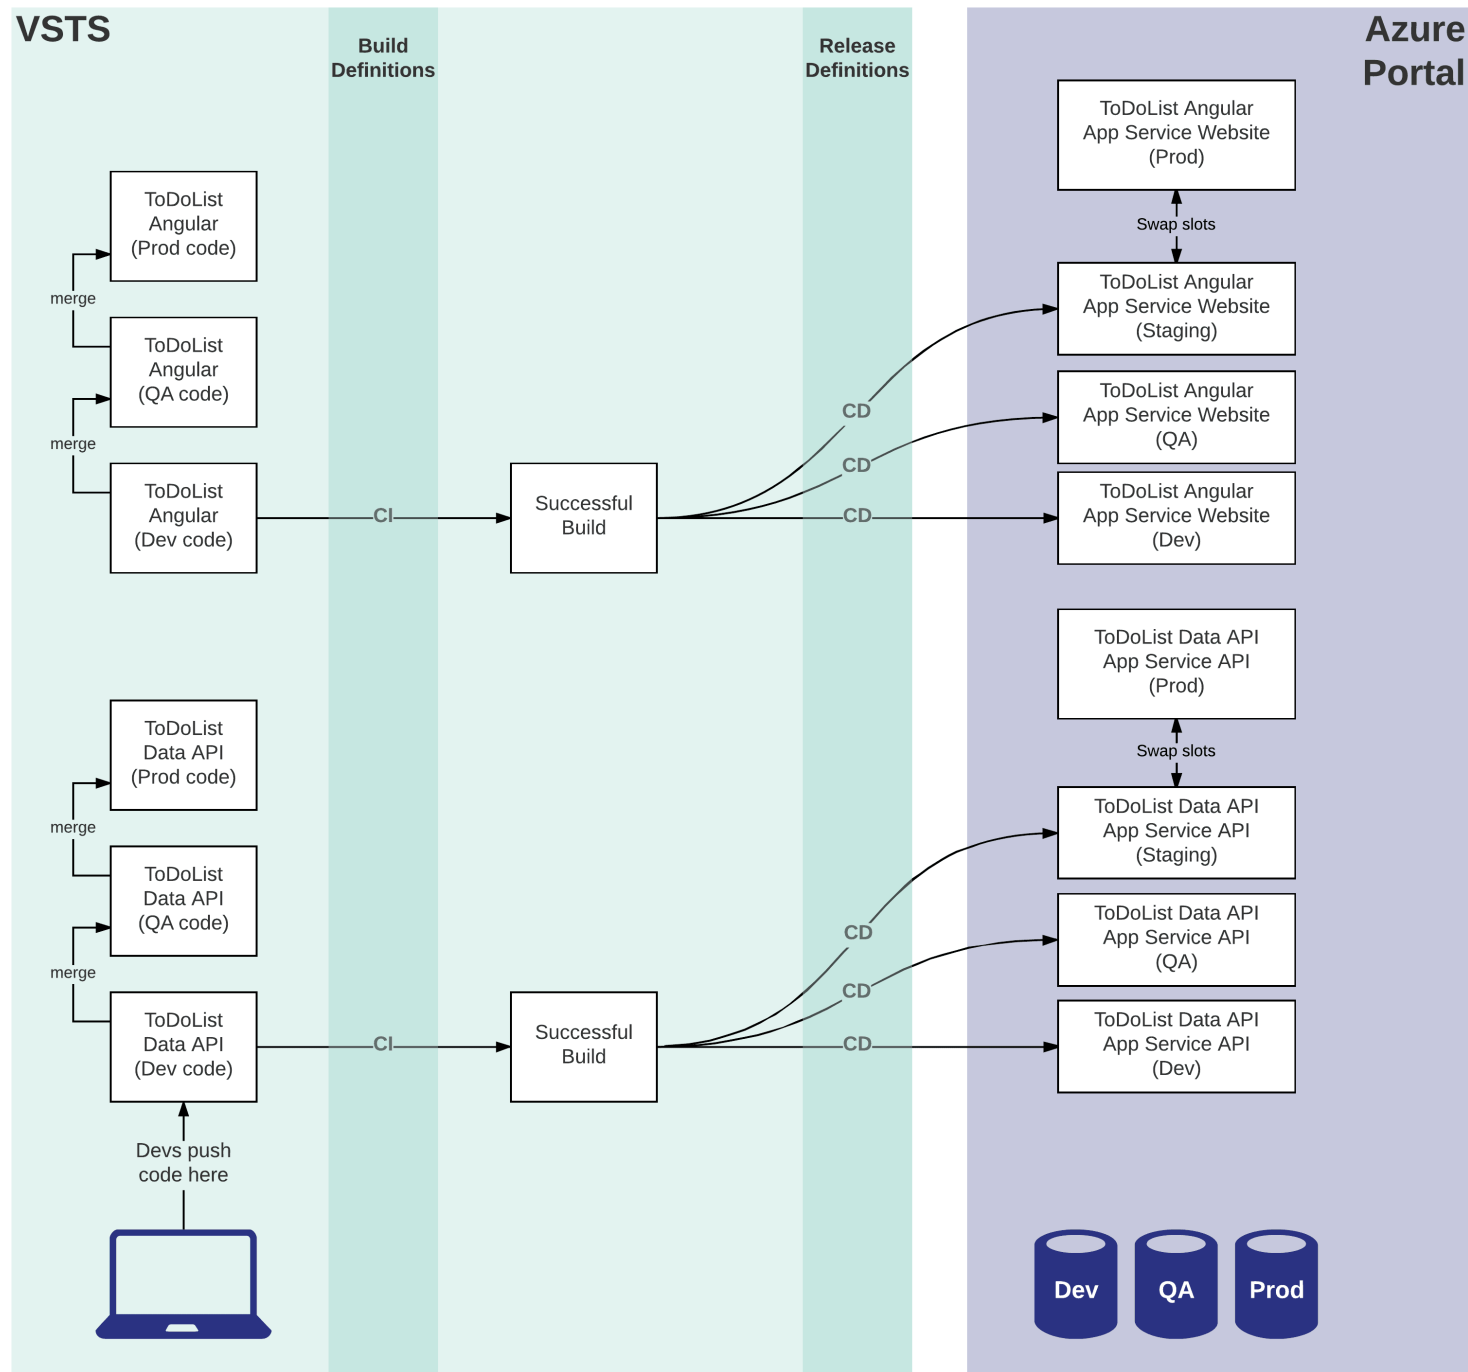

Full Environment Setup

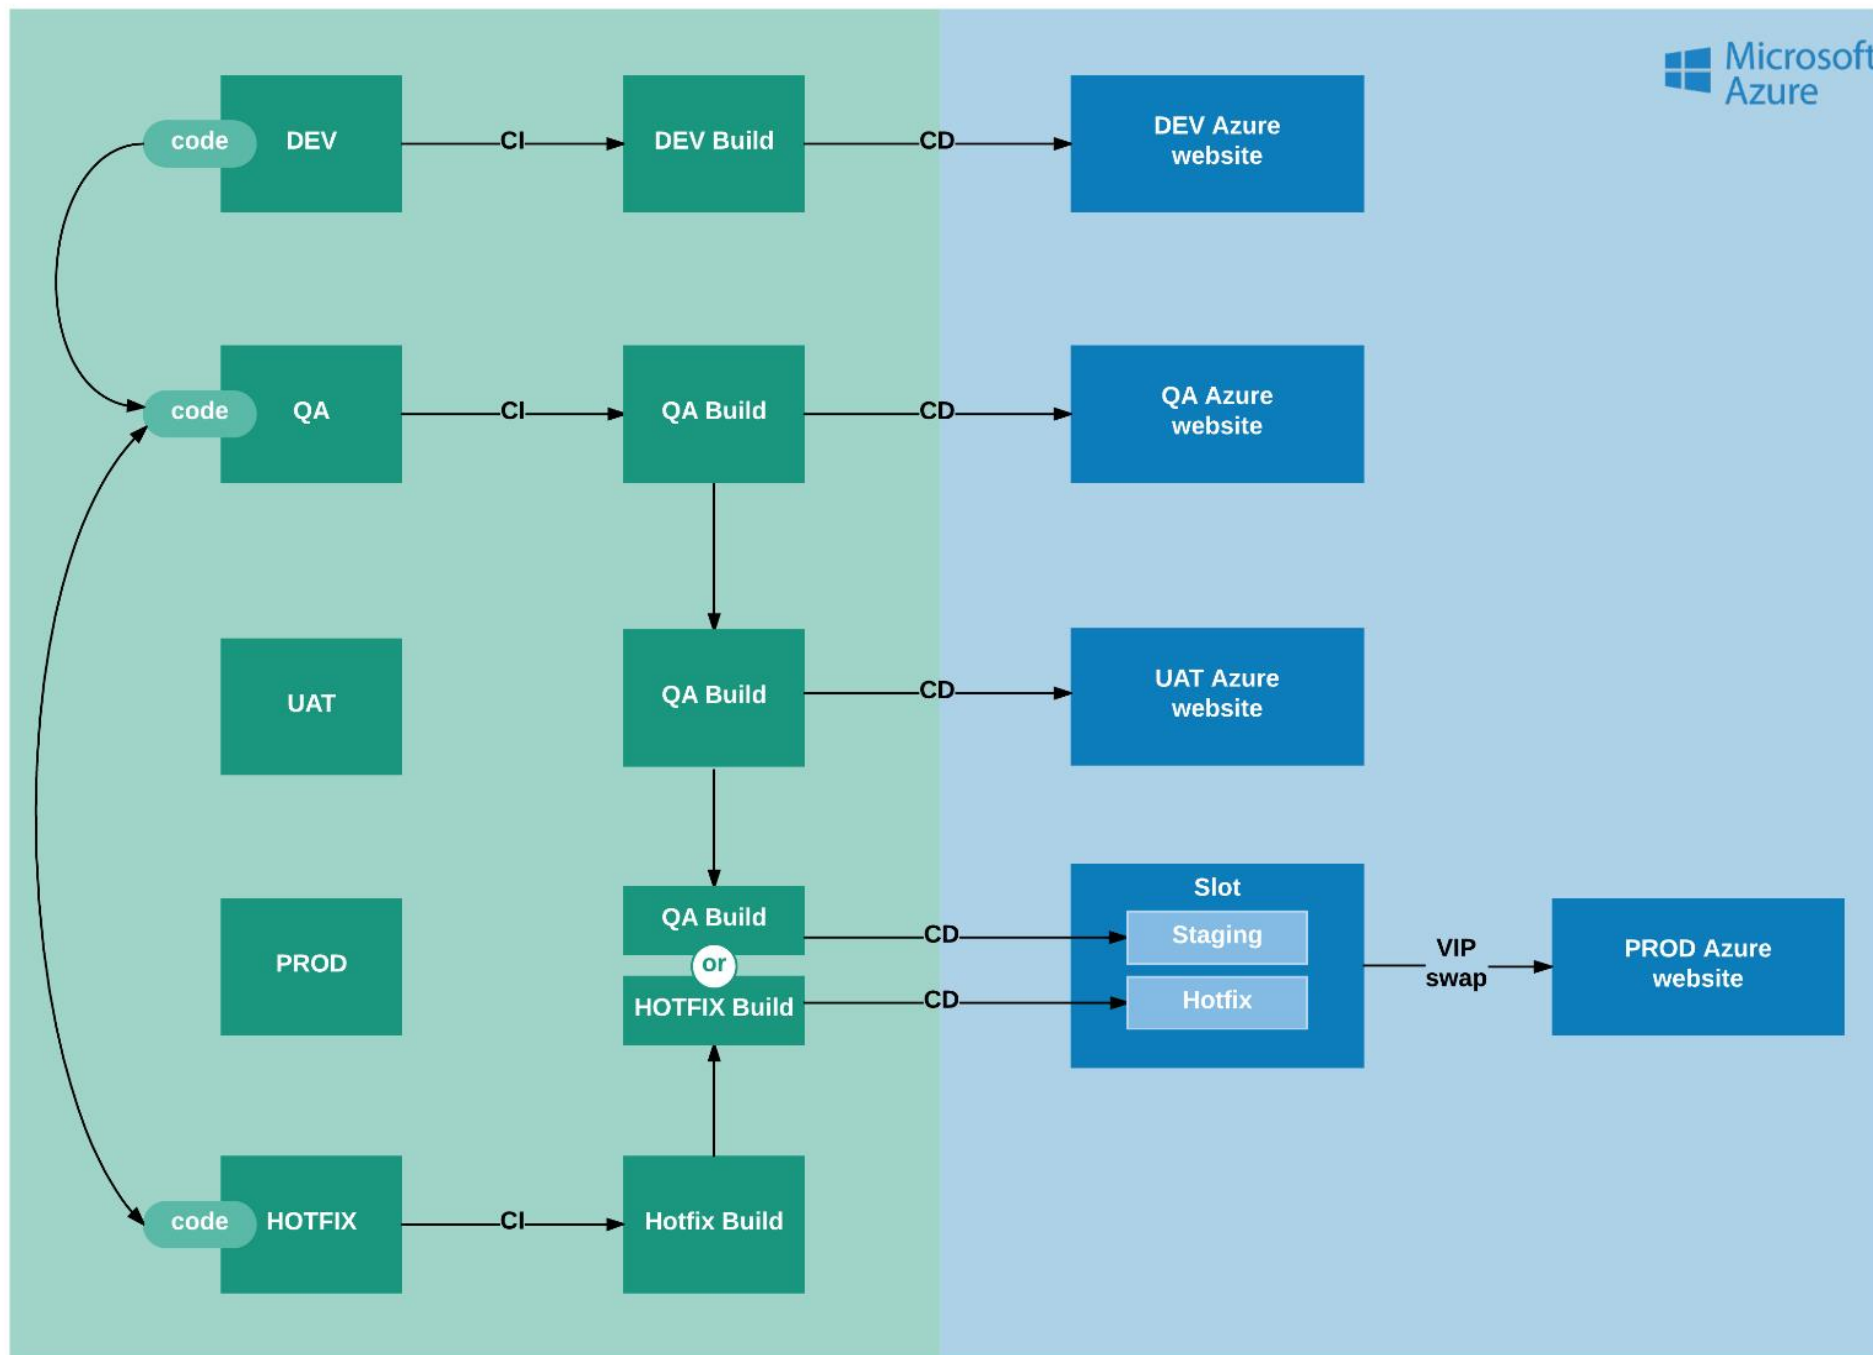

Environment Setup #1

Environment Setup #2

Environment Setup #3
